

## ABSTRACT OF THE DISCLOSURE

[0023] The present invention relates to a method for contacting at least one module for a wireless radio standard via at least one application, according to which one side of the module, which is to be contacted with the application, is provided with contact surfaces while one side of the application, which is to be contacted with the module, is provided with contact surfaces that are able to interact with the contact surfaces of the module, and a connection is established between the respective contact surfaces of the module and the application. The invention also relates to a combination of a module for wireless radio standards and an application. One side of the module, which is to be contacted with the application, includes contact surfaces (planar contact elements while one side of the application, which is to be contacted with the module, includes contact surfaces that can interact with the contact surfaces of the module and can be contacted by the contact surfaces of the module.
